Script 1

Now that anyone can build apps using AI, you need ways to make sure your AI generated apps are secure.

And since I vibe code everything, I don't actually know how to write any of the code, I need to use AI tools to find any bugs, and explain the code to me.

This is why when I commit my code to GitHub I use a tool like Code Rabbit which actually looks at all the changes I make, summarizes the changes, and then suggests new changes I should make.

I can also change the tone of the AI that looks at all my code changes to explain everything in simple language.

I can even look at a dashboard that explains all of the suggestions and potential issues with my app.

So if you like to vibe code, you're going to love code rabbit the link is in my bio to learn more.

Script 2

The future of AI Video is here.

The new Google Veo Video Model is actually insane.

And this right here is the easiest way to use it.

You can create a full video in LTX Studio put Google's brand-new VEO 2 right into its software.

Not only does it allow you to generate images, you can actually drag the camera movement in your video perfectly.

You can start with an image, describe what you want to happen, click generate, done.

And it spits out a video clip in about 7 seconds.

You can even upload your own selfies and watch them come alive.

This makes their storyboard feature much more fun to use, that allows me to plan out longer videos.

If you want access, link in my bio.

I'll be doing more updates on these AI video models so follow for more.

Using AI-generated voices has never been human!

And if you think that AI voices sound flat and emotionless, it's because you haven't tried this new text to speech tool that **actually** understands the connection between what words mean and how they should sound emotionally.

If you want to see for yourself go to hume.ai and type the style of the voice that you want, and then what you want this voice to say, and this is the result:

[play example]

The best part is, despite being the most realistic voice generator on the market, Octave is the cheapest TTS option available, and perfect for creating vibrant, engaging short form content!
